ABSTRACT OF THE DISCLOSURE

A pet mat is provided with an upper surface having a pattern of raised bumps, the configuration and spacing of which is such that a common pet bowl or dish can be placed on any part of the upper surface and the bowl will normally fall within the interstices between the pattern of bumps. The bumps prevent a bowl from moving around the mat, and a raised peripheral edge bordering the upper surface prevents spillage from escaping onto the mat support surface or floor. The mat is preferably formed from a tacky material, such a natural rubber, which further aids in the goal of reducing slippage of both the mat and the bowl placed thereon.
